# DATA COMMUNICATION

How data is transferred through internet?

- > When we click on a link that information is stored in packets.
- > Each packet is limited in size, so the data or info is stored accordingly.
- > The packets are then labelled with IP address Sender's, Receiver's and Proxy Address.
- > The packets are then launched onto the LAN (Local Area Network).
- > Local Area Network is used to connect all the computers, routers, printer for information exchanged within an office or building.
- > Then the packets reach the Router.
- > The Router provides the packets with the most efficient and the fastest path.
- > When the packets get out of this LAN, they reach the Router Switch.
- > A Router Switch is more faster and efficient as compared to Router.
- > The packets then reach the Proxy Server which acts as a gateway between user and the internet. It is used for many functionalities as well as security and privacy, depending upon the needs and the company policy.

• The proxy checks whether the URL (Web address) of the packet is acceptable or not.

• If it is acceptable the packet reaches the Firewall:

• Firewall is basically a barrier between private internet network and the public internet. It filters out the packets which contains viruses.

It also protects a companies sensitive data from being leaked on the internet.

• Now another Router receives the packet and forwards it on the desired network.

• If the packets reach this far in due time a "received message" is sent back otherwise a "timeout message" is sent back.

• The package then finally reaches the internet and is transmitted across the globe through underwater lines.

• At this point on internet there is very little security due to which many dangers are lurked.

like The Ping Of Death

• The Ping Of Death is basically an oversized or malformed packet used to crash or destabilized the network.

• Finally the packet reaches its destination where it may have to go through another firewall

• This Firewall terminates the ping of death

- One-by-One the information in the packets is received and sent to the web application.
- The packets are then Recycled ↗

This figure is a comprehensive cricket fixture calendar spanning two seasons, 2025 and 2026. It lists 10 teams: AFG, AUS, BAN, ENG, IND, IRE, NZ, PAK, SA, SL, WI, and ZIM. The calendar is organized by month and day, with each row representing a specific date. Each row contains the names of the two teams playing, the format of the match (Test, ODI, or T20), and the outcome (Home or Away). The results are color-coded: red for wins, green for losses, and blue for draws. Player statistics, such as runs, wickets, and catches, are provided for each match. The calendar also includes a column for the current season (2025/2026) and a column for the next season (2026/2027). The fixtures are arranged in a grid format, with the first few rows showing the start of the 2025 season and the last few rows showing the end of the 2026 season.
